

Amendments to the specification:

At page 10, please replace paragraph [0021] with the following paragraph:

[0021] The processor 702 divides audio data into at least one audio data group and synchronizes a current audio data group to a nearest time mark. The correlator 704 associates the current audio data group to a number of a word in text data corresponding to the current audio data group. The encoder ~~706~~ 708 packs the plurality of audio data groups along with associated word numbers into a plurality of data packets. The transmitter ~~708~~ 706 transmits and receiver 710 receives the plurality of data packets. The decoder 712 unpacks the plurality of audio data groups along with associated word numbers, and provides the plurality of audio data groups to a processor in the destination node. The decoder 712 also arranges each of the plurality of audio data groups to be synchronized to a word in the text data.
